

TESTIMONIAL

Grower's & Producer's experience with NeemAzal-T/S

Since the introduction of the biochemical/botanical insecticide NeemAzal-T/S to the New Zealand market, many growers and producers which are employing either modern chemical-, integrated- or organic management methods have experienced positive feedback which is described here:

-apple grower with integrated management in the Nelson-Moutere region has been delighted by the fact that the beneficial insect ladybug was not affected while applying NeemAzal to control the woolly apple aphid and that the fruit is free of toxic residue

-conventional glass house grower in the Auckland region advocates the fact that his various herb seedlings grown in high density are free of the spider mite and don't show any problems with mildew under humid conditions

-market garden grower (organic) in Christchurch praises the next generation product for its quality in controlling psyllid on tomato whilst not demanding a withholding period

-cutflower (roses and gerbera) producer (modern conventional in Canterbury) appreciates the safe application for the operator and the marketing edge over imports he enjoys with the clean flowers in the market

-in the viticulture sector producers in the sustainable and organic sector advocate the control of problem insects like mealy bug or bronze beetle in the Hawkes Bay and Marlborough and like to support the reality of a green and clean management method

NeemAzal-T/S is widely acknowledged and gets the thumbs up for its premium efficacy in combination with a low application rate and for its high quality standard which make it a viable economic option to the modern grower/producer in New Zealand.
